Epidemiology and Population Health

3 Credits

This course prepares DNP students to relate the science of epidemiology, including genetic and environmental epidemiology, to evidence-based nursing practice in providing care to populations. Course content will cover identifying and defining population outcomes, concepts of epidemiology used in population-based research, and using data and information technology to target at-risk populations to improve health outcomes. In addition, students will analyze health policy at the population level and interpret trends in care delivery.

Prerequisite: NURS 632
