

Statistics and Methods for the DNP Project

4 Credits

This course is designed to enhance the DNP student's ability to select and apply methods (beyond Quality Improvement) required to implement a range of scholarly project designs. Quantitative methods include data collection, descriptive and inferential statistical analyses (including linear regression) utilizing appropriate software packages. Qualitative approaches for data collection and analysis will be introduced. The course will focus on identification and selection of methods appropriate for answering clinical questions, and interpreting and presenting results obtained from these methods.
