MTP Algorithm

- MTP starts with O-negative but should be changed to type specific as soon as available
- Control the source of bleeding while continuing resuscitation
- Do not forget to call blood bank to stop the MTP when resuscitation stops
- Indication to initiate MTP is SBP <90

Blood pressure?

Hypotension
SBP <90

- Give 2 units O-negative in ED
- Order MTP activation
- Order TEG to be sent
- Continue MTP guided by TEG results
- Stop MTP when patient’s bleed is controlled

Normotensive
SBP <90

Tachycardia?

If tachycardia is suspected to be from hemorrhage go to hypotension algorithm
